Disclaimer

SolidProof.io reports are not, nor should be considered, an “endorsement” or “disapproval” of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any “product” or “asset” created by any team. SolidProof.io do not cover testing or auditing the integration with external contract or services (such as Unicrypt, Uniswap, PancakeSwap etc’...)

SolidProof.io Audits do not provide any warranty or guarantee regarding the absolute bug- free nature of the technology analyzed, nor do they provide any indication of the technology proprietors. SolidProof Audits should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.

SolidProof.io Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology. Blockchain technology and cryptographic assets present a high level of ongoing risk. SolidProof’s position is that each company and individual are responsible for their own due diligence and continuous security. SolidProof in no way claims any guarantee of security or functionality of the technology we agree to analyze.

Description

Cashio token Is a new Revolutionary Token on the Binance smart chain ecosystem with a unique Use-case that has never been seen before in the Crypto-World.

Cashio is a deflationary Buy-back token that rewards token holders for their trust in the ecosystem.

Their Buy-back system ensures that all the big sells will be bought again from the contract while rewarding holders and burning some of the Tokens.

Hold Cashio Token in your wallet and get rewards in BNB. Their distribution system ensures that rewards will be given even on low market volume conditions.

Their Reward system doesn't stop there - Being one of the biggest holders makes you eligible to earn extra rewards exclusively from the Casino earnings.

The most exciting part is that there will not be any dev-marketing wallets at launch to dump tokens to investors.

Project Engagement

During the 10th of September 2021, **Cashio Team** engaged Solidproof.io to audit smart contracts that they created. The engagement was technical in nature and focused on identifying security flaws in the design and implementation of the contracts. They provided Solidproof.io with access to their code repository and whitepaper.

Vulnerability & Risk Level

Risk represents the probability that a certain source-threat will exploit vulnerability, and the impact of that event on the organization or system. Risk Level is computed based on CVSS version 3.0.

Level	Value	Vulnerability	Risk (Required Action)
Critical	9 - 10	A vulnerability that can disrupt the contract functioning in a number of scenarios, or creates a risk that the contract may be broken.	Immediate action to reduce risk level.
High	7 – 8.9	A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way.	Implementation of corrective actions as soon as possible.
Medium	4 – 6.9	A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.	Implementation of corrective actions in a certain period.
Low	2 – 3.9	A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.	Implementation of certain corrective actions or accepting the risk.
Informational	0 – 1.9	A vulnerability that have informational character but is not effecting any of the code.	An observation that does not determine a level of risk

Auditing Strategy and Techniques Applied

Throughout the review process, care was taken to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices. To do so, reviewed line-by-line by our team of expert pentesters and smart contract developers, documenting any issues as there were discovered.

Methodology

The auditing process follows a routine series of steps:

1. Code review that includes the following:
 - i) Review of the specifications, sources, and instructions provided to SolidProof to make sure we understand the size, scope, and functionality of the smart contract.
 - ii) Manual review of code, which is the process of reading source code line-by-line in an attempt to identify potential vulnerabilities.
 - iii) Comparison to specification, which is the process of checking whether the code does what the specifications, sources, and instructions provided to SolidProof describe.
2. Testing and automated analysis that includes the following:
 - i) Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
 - ii) Symbolic execution, which is analysing a program to determine what inputs causes each part of a program to execute.
3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
4. Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts.

Used Code from other Frameworks/Smart Contracts (direct imports)

Imported packages:

- OpenZeppelin
 - Address
 - Ownable
 - SafeMath
 - Context
 - IERC20
 - IERC20Metadata
- Uniswap
 - UniswapV2Factory
 - UniswapV2Pair
 - UniswapV2Router01
 - UniswapV2Router02

Tested Contract Files

This audit covered the following files listed below with a SHA-1 Hash.

A file with a different Hash has been modified, intentionally or otherwise, after the security review. A different Hash could be (but not necessarily) an indication of a changed condition or potential vulnerability that was not within the scope of this review.

v1.0

File Name	SHA-1 Hash

Scope of Work

The above token Team provided us with the files that needs to be tested (Github, Bscscan, Etherscan, files, etc.). The scope of the audit is the main contract (usual the same name as team appended with .sol).

We will verify the following claims:

1. Correct implementation of Token standard
2. Deployer cannot mint any new tokens
3. Deployer cannot burn or lock user funds
4. Deployer cannot pause the contract
5. Overall checkup (Smart Contract Security)

Inheritance Graph v1.0

Verify Claims

Correct implementation of Token standard

Tested	Verified
✓	✓

Function	Description	Exist	Tested	Verified
TotalSupply	provides information about the total token supply	✓	✓	✓
BalanceOf	provides account balance of the owner's account	✓	✓	✓
Transfer	executes transfers of a specified number of tokens to a specified address	✓	✓	✓
TransferFrom	executes transfers of a specified number of tokens from a specified address	✓	✓	✓
Approve	allow a spender to withdraw a set number of tokens from a specified account	✓	✓	✓
Allowance	returns a set number of tokens from a spender to the owner	✓	✓	✓

Optional implementations

Deployer cannot burn or lock user funds

Name	Exist	Tested	Verified
Deployer cannot lock	✓	✓	✗
Deployer cannot burn	✓	✓	🚩

Comments:

v1.0

- Deployer can set maxTxAmount
 - maxTxAmount must higher than _tTotal/1000
- Deployer can exempt addresses from limit
- buyback() functions burns tokens when it's called

```
function buyback() private lockTheSwap{
    uint256 bbBNBForMarketing = accumulatedBNBBuyBack.mul(_bbFeeMarketingBNB).div(_PERCENR_NOMINATOR);
    uint256 bbBNBForJackpot = accumulatedBNBBuyBack.mul(_bbFeeJackpot).div(_PERCENR_NOMINATOR);
    uint256 bbBNBForBurn = accumulatedBNBBuyBack.mul(_bbFeeBurn).div(_PERCENR_NOMINATOR);
    uint256 bbBNBForMarketingToken = accumulatedBNBBuyBack.sub(bbBNBForMarketing.add(bbBNBForJackpot).add(bbBNBForBurn));

    payable(walletMarketing).transfer(bbBNBForMarketing);
    payable(walletJackpot).transfer(bbBNBForJackpot);
    buyTokens(bbBNBForBurn, walletDEAD);
    buyTokens(bbBNBForMarketingToken, walletMarketing);

    //Reset accumulated BNB for buyback.
    accumulatedBNBBuyBack = 0;
}
```

- Addresses are not allowed to transfer when following condition is not true

```
function checkWalletLimit(address recipient, uint256 amount) internal view {
    require(balanceOf(recipient).add(amount) <= _maxWalletAmount || isWalletLimitExempt(recipient), "Wallet Amount Limit Exceeded");
}
```

- Deployer can lock claim
 - With setting _minPeriod Time

claimReward function

```
function claimReward(address shareholder) external onlyToken{
    require(shares[shareholder].lastTimeClaim + minPeriod <= block.timestamp, "You are only able to take reward once every 12 hours");
    require(shares[shareholder].amount >= minTokenToReceiveReward, "Please check minimum token amount to receive reward");
    distributeDividend(shareholder);
}
```

Set minPeriod function

```
function setDistributionCriteria(uint256 _minPeriod, uint256 _minTokenForReceiveReward) external override onlyToken {
    minPeriod = _minPeriod;
    minTokenToReceiveReward = _minTokenForReceiveReward;
}
```

Deployer cannot pause the contract

Name	Exist	Tested	Verified
Deployer cannot pause	✓	✓	✓

1. approve	→
2. claimReward	→
3. decreaseAllowance	→
4. enableFeeSystem	→
5. increaseAllowance	→
6. lock	→
7. renounceOwnership	→
8. setBuybackThreshold	→
9. setDistributionCriteria	→

Legend

Attribute	Description
Lines	total lines of the source unit
nLines	normalized lines of the source unit (e.g. normalizes functions spanning multiple lines)
nSLOC	normalized source lines of code (only source-code lines; no comments, no blank lines)
Comment Lines	lines containing single or block comments
Complexity Score	a custom complexity score derived from code statements that are known to introduce code complexity (branches, loops, calls, external interfaces, ...)

Audit Results

AUDIT PASSED

Critical issues

- no critical issues found -

High issues

- no high issues found -

Medium issues

- no medium issues found -

Low issues

Issue	File	Type	Line	Description
#1	Main	Contract doesn't import npm packages from source (like OpenZeppelin etc.)	-	We recommend to import all packages from npm directly without flatten the contract. Functions could be modified or can be susceptible to vulnerabilities
#2	Main	A floating pragma is set	43	The current pragma Solidity directive is „^0.6.12“.
#3	Main	Missing Zero Address Validation (missing-zero-check)	1438, 1442	Check that the address is not zero
#4	Main	State variable visibility is not set	871, 881, 884, 885, 886, 887, 889, 890, 892, 893	It is best practice to set the visibility of state variables explicitly
#5	Main	Missing Events Arithmetic (events-maths)	774	Emit an event for critical parameter changes

Informational issues

Issue	File	Type	Line	Description
#1	Main	State variables that could be declared constant (constable-states)	746, 853, 850, 848, 849, 844, 893, 881	Add the `constant` attributes to state variables that never change

Audit Comments

14. September 2021:

- There is still an owner (Owner still has not renounced ownership)
- Developer can
 - set buy back threshold
 - Enable/disable swap and liquify
 - When it's disabled you are not allowed to swap tokens or use buy back functions
- See „*deployer can burn or lock user funds*“ comments

SWC Attacks

ID	Title	Relationships	Status
SW C-13 6	Unencrypted Private Data On-Chain	CWE-767: Access to Critical Private Variable via Public Method	PASSED

SW C-10 0	Function Default Visibility	CWE-710: Improper Adherence to Coding Standards	PASSED

The logo features the word "SolidProofed" in a white, cursive script font. The text is set against a dark blue background that includes a faint, stylized shield emblem. The shield has a grid-like pattern and a blue-to-white gradient. The word "Solid" is positioned above "Proofed", and the "P" in "Proofed" is large and loops around the "S" in "Solid".
